

Observation heterogeneity is part of the result

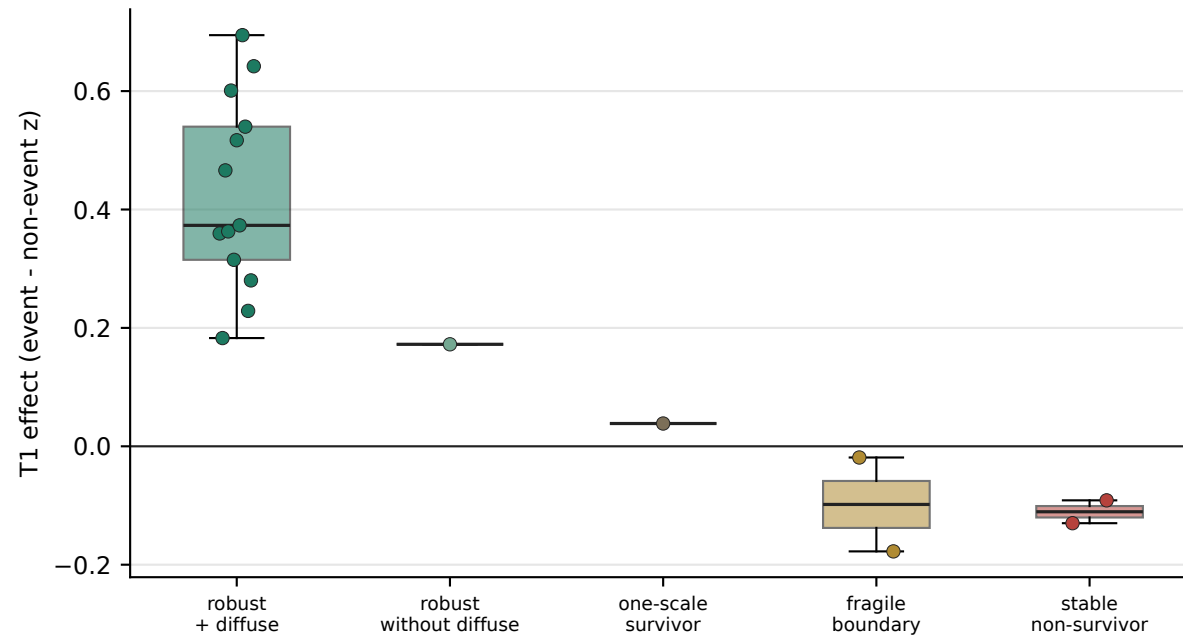

A. Observation x evidence matrix

B. Descriptive metadata association
Spearman rho=0.511

C. T1 effect by observation class

D. Class summary (descriptive only)

- robust survivor with diffuse support: $n=13$, median T1=0.373, median track=523
- fragile boundary: $n=2$, median T1=-0.0982, median track=193
- stable non-survivor: $n=2$, median T1=-0.111, median track=352
- one-scale survivor: $n=1$, median T1=0.0385, median track=417
- robust survivor without diffuse support: $n=1$, median T1=0.172, median track=217

Metadata labels are descriptive annotations, not causal regime explanations.
